ABSTRACT

In one embodiment, a method of providing server enhancement, includes: providing a dynamic link library for communicating with a master configuration file to permit changes to at least one editable variable that is associated with an application program. The method may also include: selecting a code line that contains a variable associated with a setting of the application program. The method may also include: replacing the variable in the code line with a new variable associated with a modified setting of the application program. The variables associated with editable settings, of at least one application program, are editable in a single location. In another embodiment, an apparatus for providing server enhancement can perform the above method.
